The pie charts below show the average household expenditures in a country in 1950 and 2010

Overall, it is clear that in housing had higher spending than health care in most categories.

The highest spending was in 1950 about 72.1% while the lowest was 2010 around 2.4%.

In 1950, housing accounted for about three quarters of total spending (72.1%), while food represented just over a tenth. In contrast, in 2010 food increased significantly to around a third (34%), becoming the largest category. Housing, on the other hand, dropped sharply to just over a fifth (22%). Moreover, healthcare rose from only a small minority (around 2.4%) to about 14%. Education and transportation also increased slightly, reaching around 6% and 4.5% respectively in 2010. Other expenses grew from about 4.4% to nearly a fifth (19.2%). In conclusion, housing generally spend more than health care with some difference in certain categories.
