

The results

The results of the questionnaire are organized into three main research questions (RQ1, RQ2, and RQ3). Each research question includes several items that explore different aspects of the impact of social media on children's eating habits. The responses were collected and converted from pie charts into bar charts to make them clearer and easier to compare. Each chart presents the percentages of respondents' answers using the three-point Likert scale (Agree, I don't know, Disagree).

(RQ1: What are the effects of social media on children's eating habits?)

Chart 1 shows the answers for RQ1 regarding the effects of social media on children's eating habits. The majority of respondents agree with most statements. For instance, 88.6% of respondents agreed that social media makes their child want to try new foods, and the same percentage agreed that it increases their child's interest in fast food. In addition, 65.7% agreed that their child prefers foods seen on social media and that social media negatively affects their eating habits. On the other hand, smaller percentages selected "I don't know" and "Disagree" across all statements. Overall, the results indicate that social media has a strong influence on children's eating habits.

(RQ2: Why do children rely on social media for their food habits?)

Chart 2 shows the answers for RQ2 regarding why children rely on social media for their food habits. Most respondents agree with the statements. For example, 68.6% agreed that influencers affect food choices, and 57.1% agreed that children follow food-related accounts. In addition, 54.3% agreed that children trust food content on social media. However, only 40% agreed that children use social media to decide what to eat, while 57.1% disagreed. Overall, the results show that social media influences children's eating habits.

(RQ3: How can parents eliminate the negative effects of social media on their kids?)

Chart 3 shows the answers for RQ3 regarding how parents can reduce the negative effects of social media on children’s eating habits. The majority of respondents agree with most statements. For example, 88.6% agreed that they guide their child to choose healthy foods, and 80% agreed that limiting social media improves eating habits. In addition, 77.1% agreed that they monitor their child’s use of social media, while 74.3% talk to their child about unhealthy food advertisements. On the other hand, smaller percentages selected “I don’t know” and “Disagree.” Overall, the results indicate that parents play an important role in reducing the negative effects of social media.

In conclusion, the results show that social media has a strong impact on children’s eating habits. Most respondents agreed that it influences food choices, while parents play an important role in reducing these effects. Overall, parental guidance and control are important in improving children’s eating habits.
